Not tested parts:

- com.cardio_generator: HealthData Simulator
 - Reason: It includes mostly void functions, which are not testable with simple output-based assertion tests.
- com.cardio_generator.outputs module
 - Reason: void methods do not return a value, therefore they cannot be verified and tested with simple output-based assertion methods.
- com.dataAccess: FileDataListener and TcpDataListener
 - Most of its functions are voids: startListening, stopListening. So, they do not return a specific assertable value.
- com.cardio_generator.generators: Alert Generator
 - Reason: Contains only one void function above the constructor.
- com.data_management DataStorage.main()
 - Reason: Main methods are excluded from unit tests, because their primary purpose is to act as the application entry point and coordinate behaviour rather than to implement core business logic.
